Checking how well your medicine is working

Blood thinners help to prevent blood clots. They are used to treat and prevent blood clots in people with heart disease, stroke, and other conditions. There are two main types of blood thinners: **warfarin** and **direct oral anticoagulants (DOACs)**. Warfarin is a **VKA** (Vitamin K Antagonist) and DOACs are **NOACs** (New Oral Anticoagulants).

Warfarin is a **VKA** and is used to prevent blood clots. It is a **DOAC** (Direct Oral Anticoagulant) and is used to prevent blood clots. **DOACs** are **NOACs** (New Oral Anticoagulants) and are used to prevent blood clots. **NOACs** are **DOACs** (Direct Oral Anticoagulants) and are used to prevent blood clots.

If you take warfarin or other VKA pill

Warfarin is a **VKA** (Vitamin K Antagonist) and is used to prevent blood clots.
